## TMSP OBSERVERS CHALLENGE - 2012

## PLEASE READ - SEVERAL CHANGES FOR THIS YEAR

We are heading North for this years list, exploring an area of the sky often ignored. This years list is designed for observing on the main observers field so if you have planted yourself with trees to the North you will not be able to do this list.

There is also a slight change in formatting and an exploration of the night sky, MORE than just a list. There are 30 list items and closer to 3 times this many objects listed. The fun this year is not only locating a list object but also observing groups of objects. You will find multiple galaxies in one field of view or a galaxy and double stars or other combinations. Observing any One object in each list item gets you your needed check off - please note, observing more than one object in each list group doesn't earn any additional credit - but stopping and observing the others will make your time more fun. Most groups listed are within a 1 degree field of view. Objects found at the top of list should be done first as these are rapidly going down (setting). The last object, Kemble's Cascade wont be observable until later in the evening so plan accordingly.

Not all objects require a telescope, so think about what you are trying to observe. There will be some volunteers with large aperture scopes assigned with the task of assisting those observers with objects beyond their reach. The large aperture volunteers will have a sign designating their location, objects to be observed and times for public viewing. Need help? Don't be shy, ask for assistance. If you are a first timer to TMSP observers challenge we might recommend you start with the the first list (2007) as generally this is an easier list. However this years list will also be an excellent introduction to your night sky experience. You might consider observing with a partner, much more fun!!! Don't be shy, just about anyone with a scope on the field will be happy to help with an object or two. Yes, there are some tough items on the list, hence the name "Observer's challenge." Part of the concept of the challenge is to take you a little out of your comfort zone, to explore objects that you might not normally view or to look at the night sky with a little different perspective. Most of all, we want you to enjoy the hunt.

This year we also added finder charts for all objects. These charts are available as a single pdf file that you can download from the website. There are 30 star charts, take a look and see what to expect for this years challenge. One booklet containing a copy of the charts will be at the TMSP information booth.

As always the ever popular \#31 is on the list - Observers choice, you choose your favorite, easy, difficult, or? Your choice, and who knows, you may even see a future challenge list made up of TMSP "favorites", chosen by YOU!

All observations must be made at TMSP and 25 out of 30 objects must be viewed to earn a unique TMSP Observer's Award lapel pin. Again, viewing multiple objects in a "group" does not count extra toward your 25. Viewing ANY ONE of the group members DOES count. A good example is: List item \#2 which consists of 5 galaxies. Viewing any or all of the galaxies allows you to check off list item \#2, counting as 1, of your 25 required items to earn the pin.

You must create a record of your observations which include date, time, instruments used and a brief description and/or sketch of the object.
Your records will be returned to you.

Most importantly:

## HAVE FUN!!!!

## 2012 TMSP Observer's challenge
